

# EARTH DAY

Earth Day is celebrated all over the world on 22nd April every year. This day was established for awareness of the environment and its safety. Earth Day was founded in 1970 by American Senator Gaylord Nelson. Nelson first told the people how much damages happen to the environment is due to industrial development.

For this, Nelson mobilized American society, protested and done several mass movements. As a result of this movement, the government had to listen to the demands of these agitators. And by looking at the many environmental-friendly decisions are taken by the government. And this issue was kept in the United Nations to discuss this issue globally. More than 192 countries supported this issue in the United Nations.

And everyone encouraged environmental protection in their respective countries. Environmental protection is a very important topic. All the natural things present on earth like wind, water, trees, plants, and all of this together make our environment. All these things together with each other balance the environment. It is our duty to protect our environment. Nature has given us air, water, trees, plants, rivers, mountains, and minerals present below the earth for our help.

We can earn money through our hard work, but neither we can make natural things nor increase it. All these things given by nature are limited. So, on Earth Day people are made aware of the environment.

The Earth is a unique planet in the universe. It should be the responsibility of every human being to take care of its environment. If the inhabitants of planet Earth want their common house to be a blooming garden, then they should make efforts to protect it.

The ecology of the Earth suffers stronger and stronger every day. A huge problem on Earth is the cluttering of the soil cover with household and industrial wastes, heaps and garbage dumps, heaps of chemical, construction, household waste scattered in forest tracts, along roadsides, in ditches. The volume of waste is steadily growing, they are not processed, but are exported to landfills.

Extinct animals die due to deforestation, many aquatic mammals and fish have long been threatened with extinction due to pollution of water bodies. In many parts of the planet, people suffer from respiratory problems due to poor ecology.

The symbolism of Earth Day is the balance and balance of the equinox. On this day, every person and institution should act as trustees of the Earth and look for what can be done in the field of ecology, economics, and ethics for the benefit of people and the planet.

To conclude, education and action are the two most valuable steps we can take to protect our planet. Earth Day is the day to star
