

Environmental Degradation

Environmental degradation is also a major problem. There are many ways in the world that human impacts the environment. Deforestation causes major environment problems because it controls carbon dioxide in our nature. The roots of trees hold on to the soil and prevents soil erosion.

The environment through depletion of resources such as air, water and soil, the destruction of ecosystems, and pollution. Environmental degradation can cause by natural or by human also. Heavy rain, floods, storms, earthquakes, etc are not under human control and can make the land unfit. The overuse of resources is it land or water and the industrialisation process are the major causes. Our population is increasing fast, which has also degraded the environment to a great extent. The smoke of industries contains may undesirable gases such as carbon monoxide and sulphur dionide.

The factories disposable should ^{not} discharge them into the river.

We must realise the fact that so long environment is there, our life is there. Without environment we can't survive.
