Environmental Degradation: need to save our mother nature

Environmental degradation is one of major concern of today's world. Environmental degradation in layman language means the depletion or destruction of environmental resources such as air, water and soil. It also includes the excessive harm humans cause to the natural ecosystems and wildlife and changes in atmospheric cycles also. This includes all kind of destruction human world cause to nature.

There are many causes of environmental degradation. One of the major cause of this is land degradation. In many parts of world over mining and over grazing have led to degradation of land. The things that humans do for their own benefit have always been hazardous for our mother nature. The rising level of deforestation in the world has led to soil degradation. If there will be no trees the top layer of soil will be depleted automatically. Cutting of trees also lead to disturbances in atmospheric cycle of gases. Pollution is also a cause. Pollution of water or soil both leads to disturbances in natural ecosystems. We people carelessly throw our plastic waste in water without even thinking

that plastic can choke a living being in water. Smoking and many other human activities directly or indirectly harm the nature. As human beings are only ones responsible for all this damage so we people should also think for a solution to this and save our "Mother Nature".

To protect our mother we donot need to do much but all we need to do is to be a bit caring towards her. We should avoid using plastic or poly bags instead we should use cloth bag. Every one should plant at a tree in one year. We should adapt all good practices that favour nature.

We are still not too late to save nature, if we donot save it now then remember there is always tit for tat. Our second mother is also as important as our first mother. Love mother nature the same way you love your mother.
